safety couplers.

couplers and

Theory of Operation:

The valve assemblies allow the operator to inflate the lift bags with the controller and then disconnect the valve and hoses from the controller without deflating the bags.

The valve assembly allows the bag to be deflated without the controller connected.

The valves should be installed between the controller and lift bag hose. Never install the valve directly on the lift bag. Install on the hose and keep a safe distance should the bag fail for any reason.

The relief valve releases air if an over-pressure situation develops and stops releasing air when pressure returns to normal.
